Planning a Trip

How much time you spend to
choose a flight?

Planning a Trip

- **3.5h** European travellers spend on average to find a perfect flight, often longer than the flight itself <https://goo.gl/74CivT>

Planning a Trip

- **3.5h** European travellers spend on average to find a perfect flight, often longer than the flight itself <https://goo.gl/74CivT>

How much of you choose airline
by price?

Planning a Trip

- **3.5h** European travellers spend on average to find a perfect flight, often longer than the flight itself <https://goo.gl/74CivT>

- **37%** of users choose airlines by competitive price, more want to see cheapest price for comparison <https://goo.gl/8UX3vx>

Skyscanner in a Nutshell

- Each user search triggers dozens/hundreds requests to partners resulting in a total of **7B/day quotes**

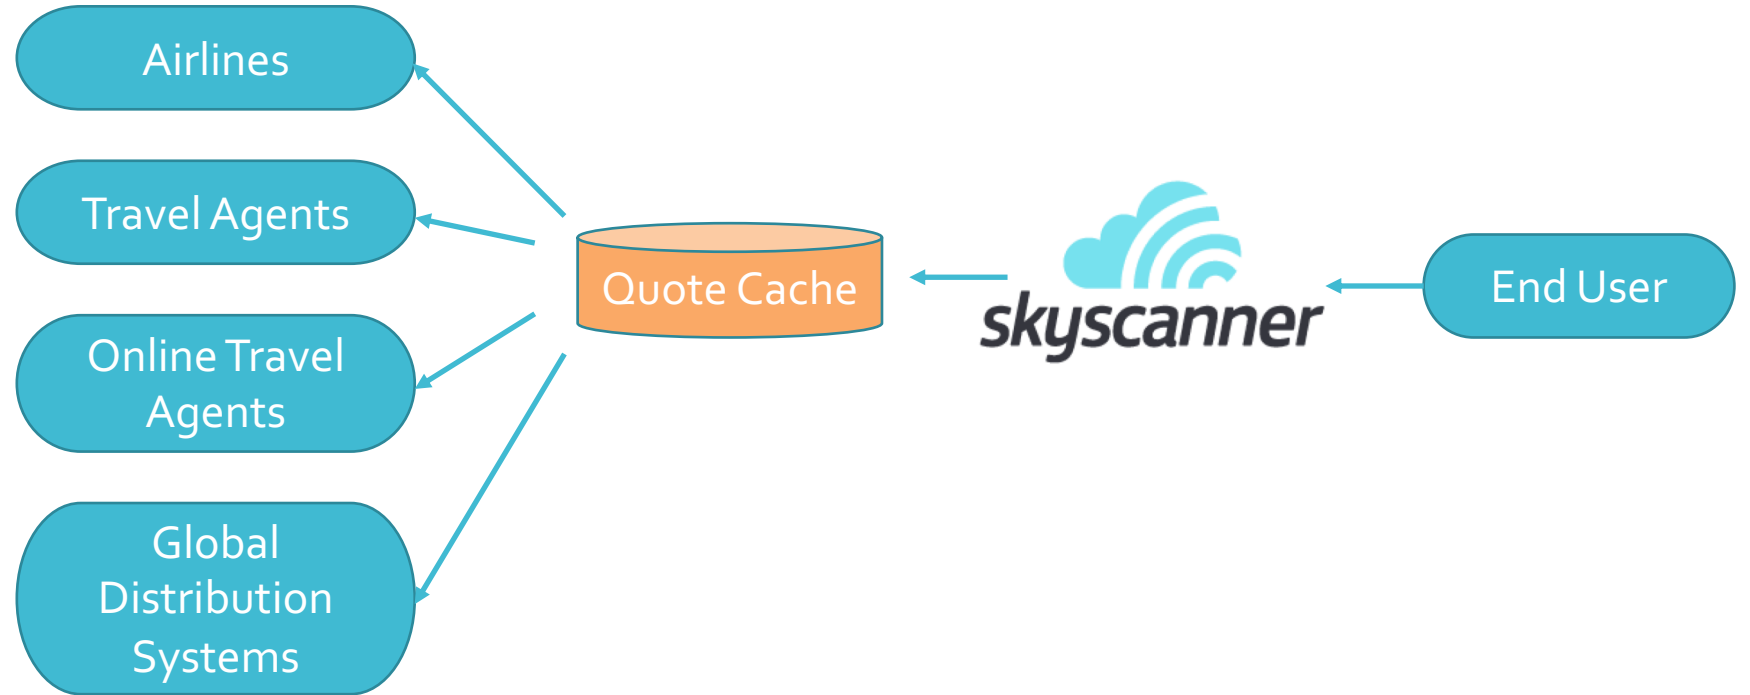

Skyscanner in a Nutshell

- Each user search triggers dozens/hundreds requests to partners resulting in a total of **7B/day quotes**

- Repeated requests with **85% probability** return same price

Caching Quotes

Strong case for caching quotes:

- reduced load on partners
- faster results to end users

Problem with Caching

Prices are changing dynamically, so, caching may introduce inaccuracies

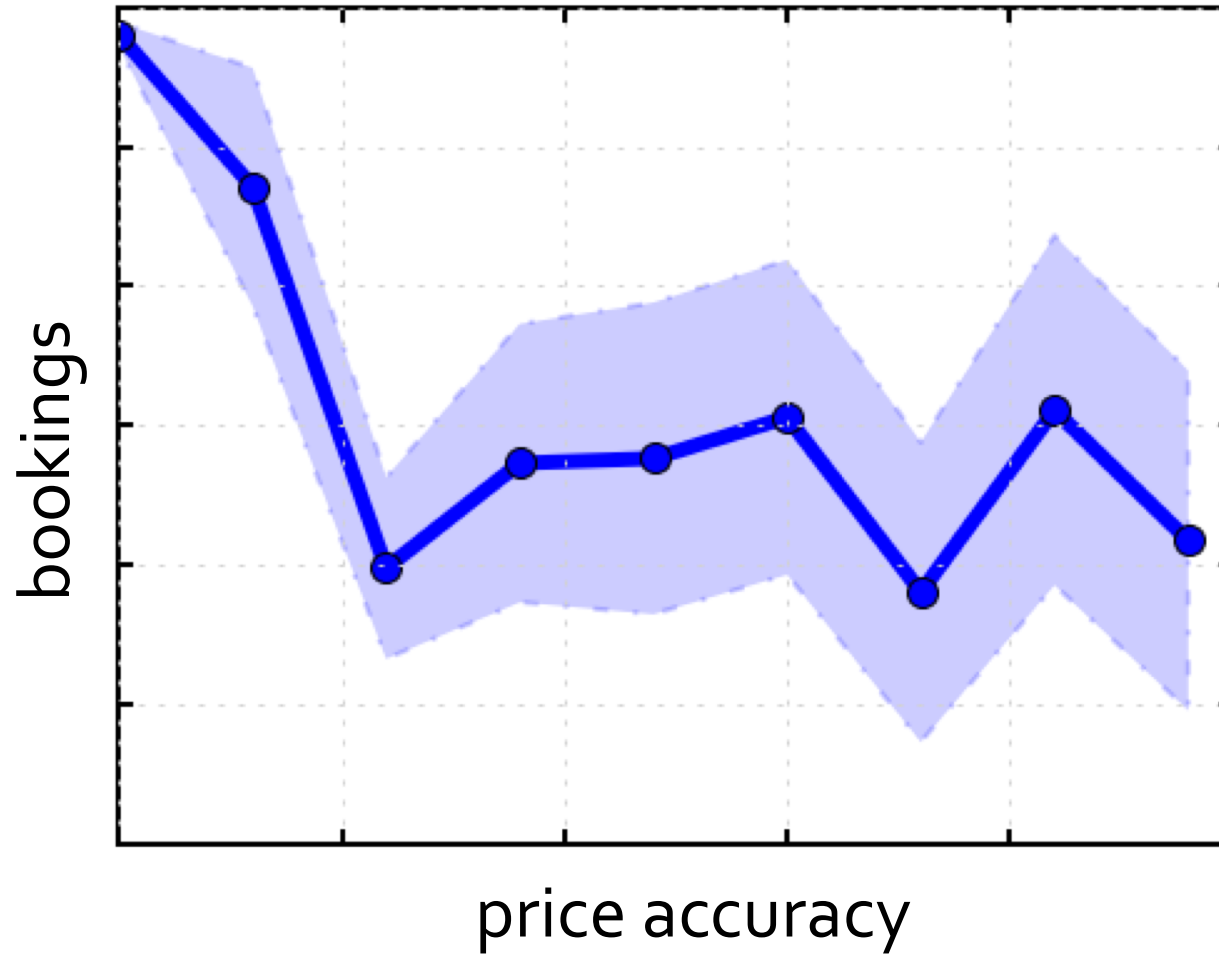

Checking this fare is still available

£77
per adult

Analysis

Bookings drop significantly even if the prices are slightly inaccurate

Caching Trade-off

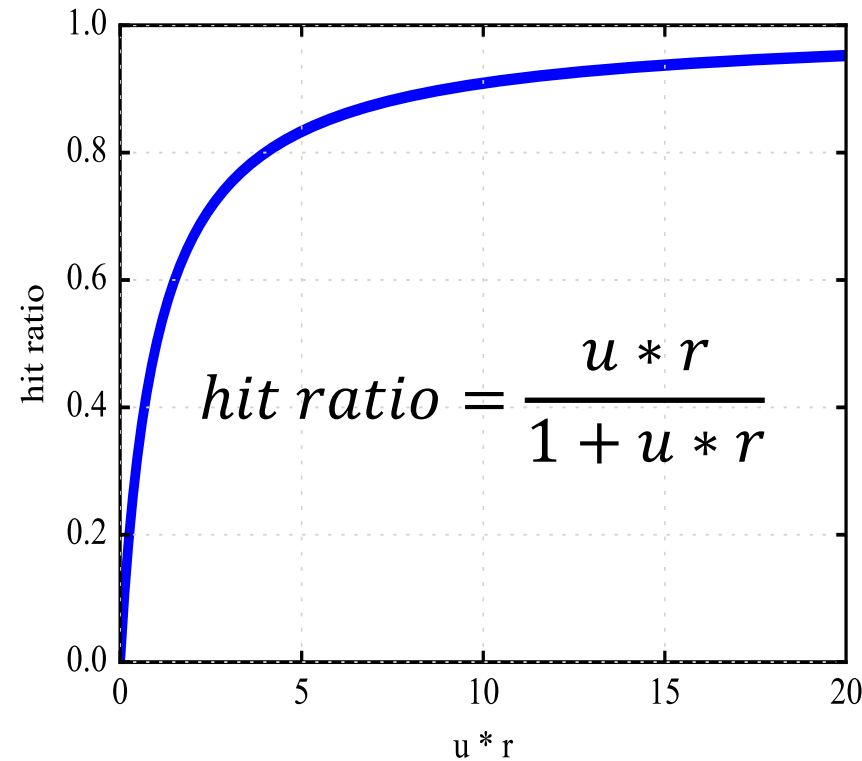

Accuracy of Quotes

Load on Partners
and Response Time

Optimal trade-off: Update prices only/always when they change

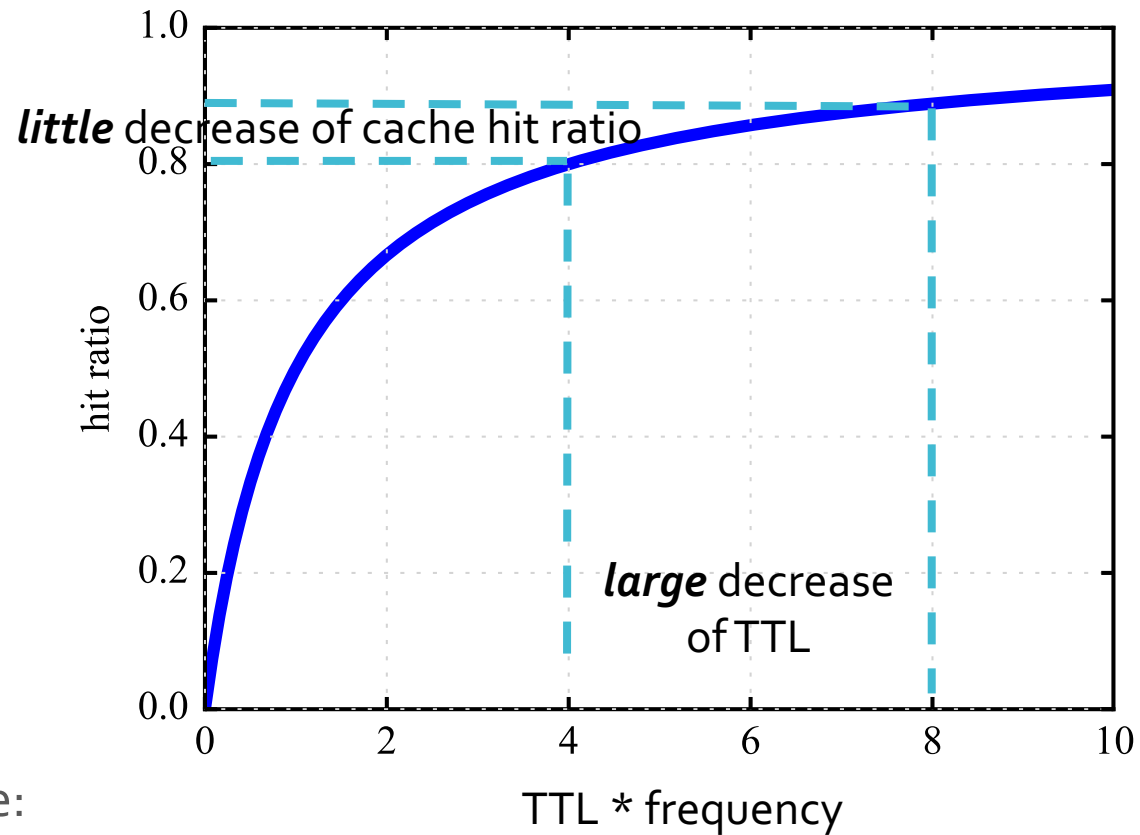

Erlang's Loss Model

- u – TTL of the cached quote
- r – frequency of requests

assuming “memoryless”
Poisson arrivals

Simple Strategy

Example:

- $u = 8h, r = 1/h, \text{ hit ratio} = 88\%$
- if we decrease TTL by half ($u = 4h$) \Rightarrow $hit\ ratio$ will decrease by only 8%
- at the same time we will decrease (by half?) the average age of cached quotes served to users

Price Volatility Not Easy

From:

Moscow

To:

Barcelona

Price Volatility Not Easy

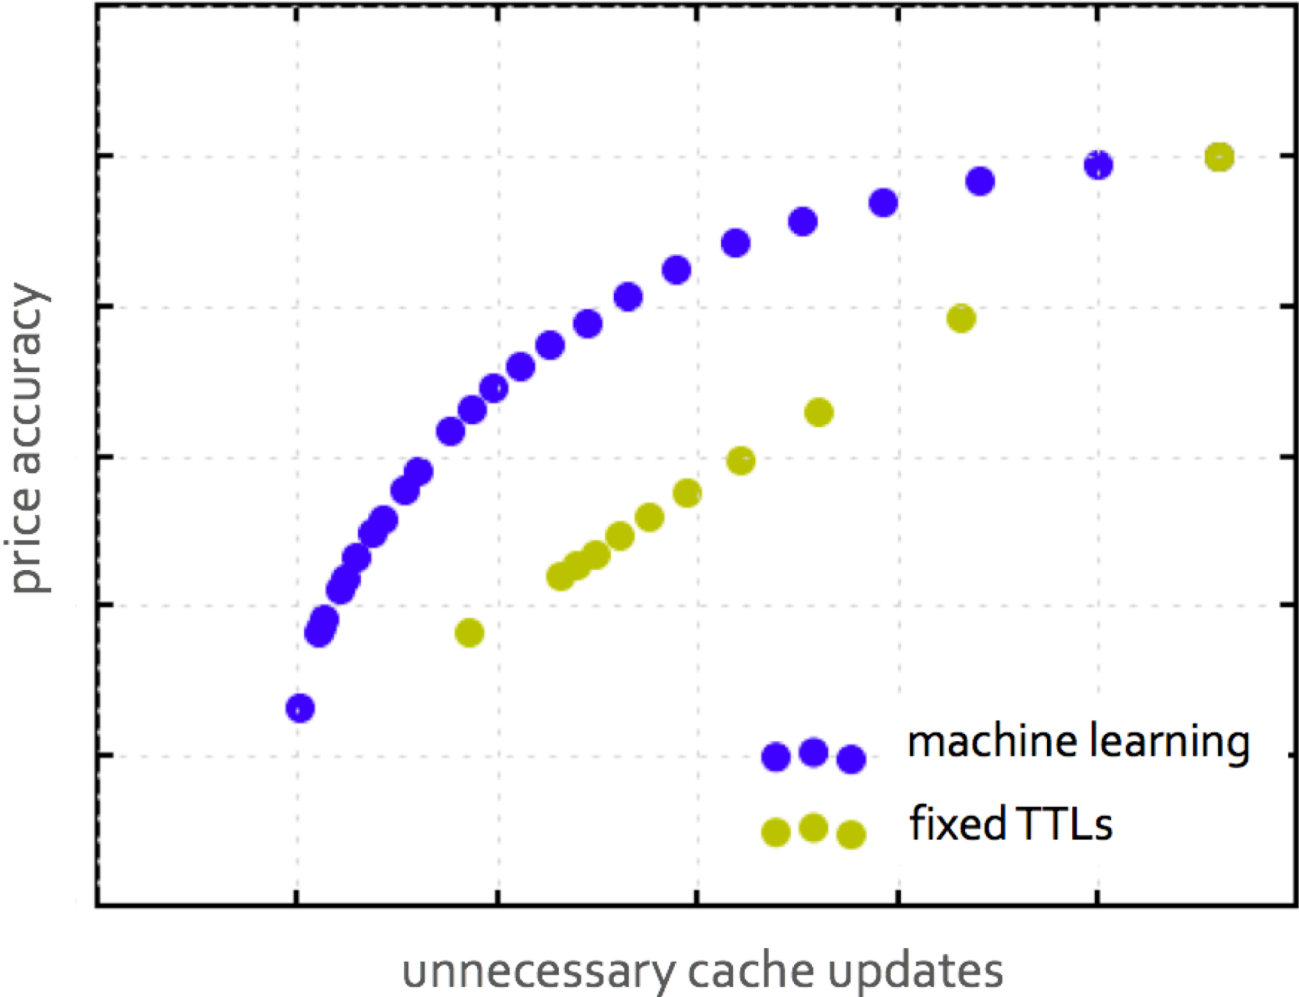

From: To:

Predicting Price Volatility

1. Approach N1: **constant** cache expiry times
 - simple to implement
 - does not accurately model price volatility
2. Approach N2: **emulate pricing models** of each individual partner
 - pricing models of some airlines are incredibly complex
3. Approach N3: **machine learning** approach
 - best trade-off between simplicity and accuracy

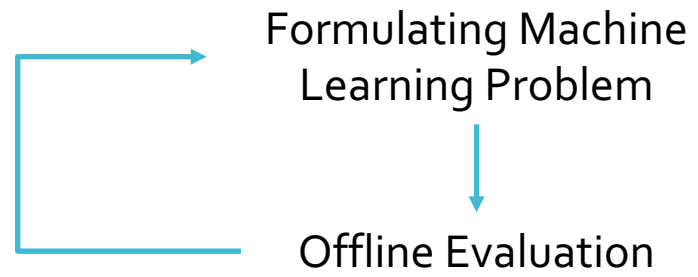

Model Performance

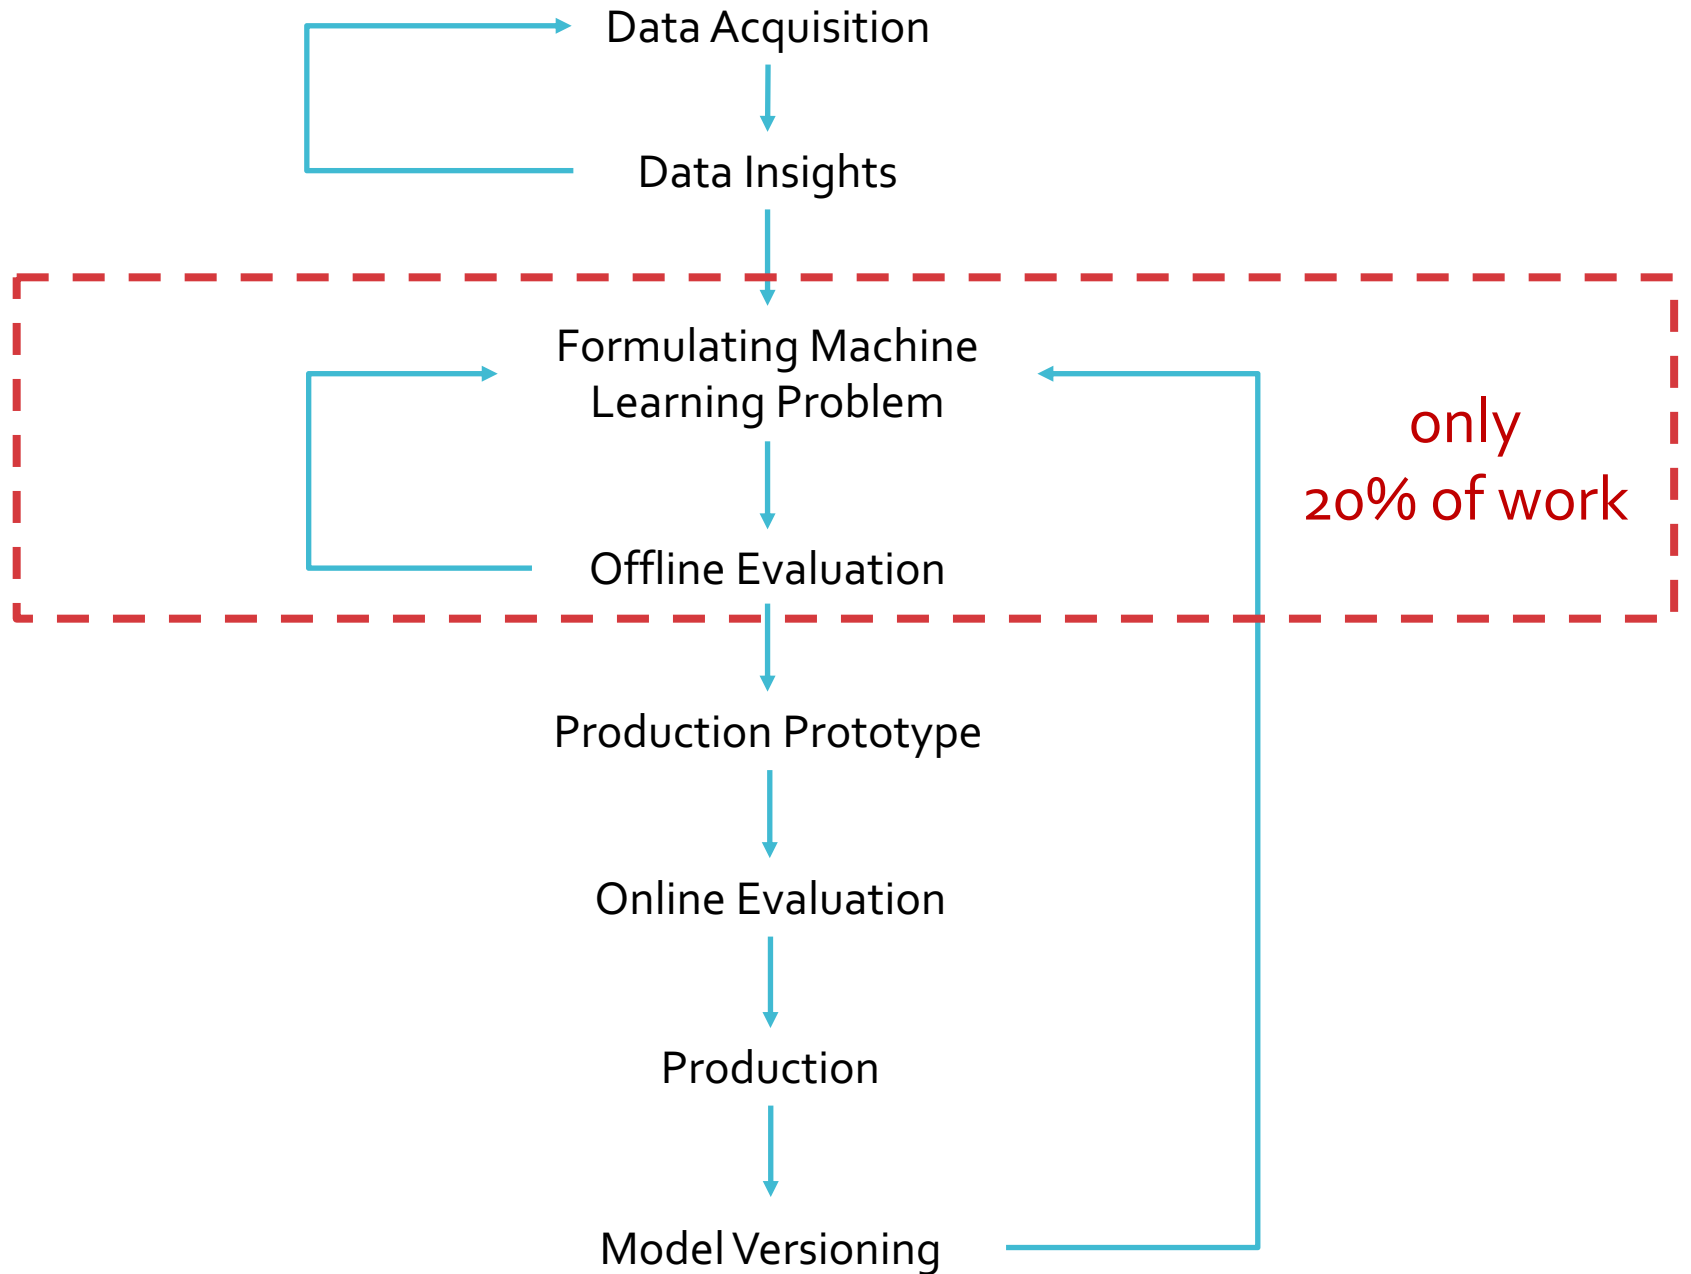

Data Science

Product Cycle

Product Cycle

Data Science Structure

CENTRALISED

EMBEDDED

- + Great autonomy
- Risk of marginalization

- + Ensured utilization
- Lesser autonomy, focus on second-class tasks

<https://goo.gl/5cdPjP>

Hybrid Structures

HUB & SPOKE

- part-time embedded, part-time autonomous

<https://goo.gl/WJv8TR>

DATA SCIENCE CLUSTERS

- clusters of embedded data scientists focused on the same goal

<https://goo.gl/mtQvyn>

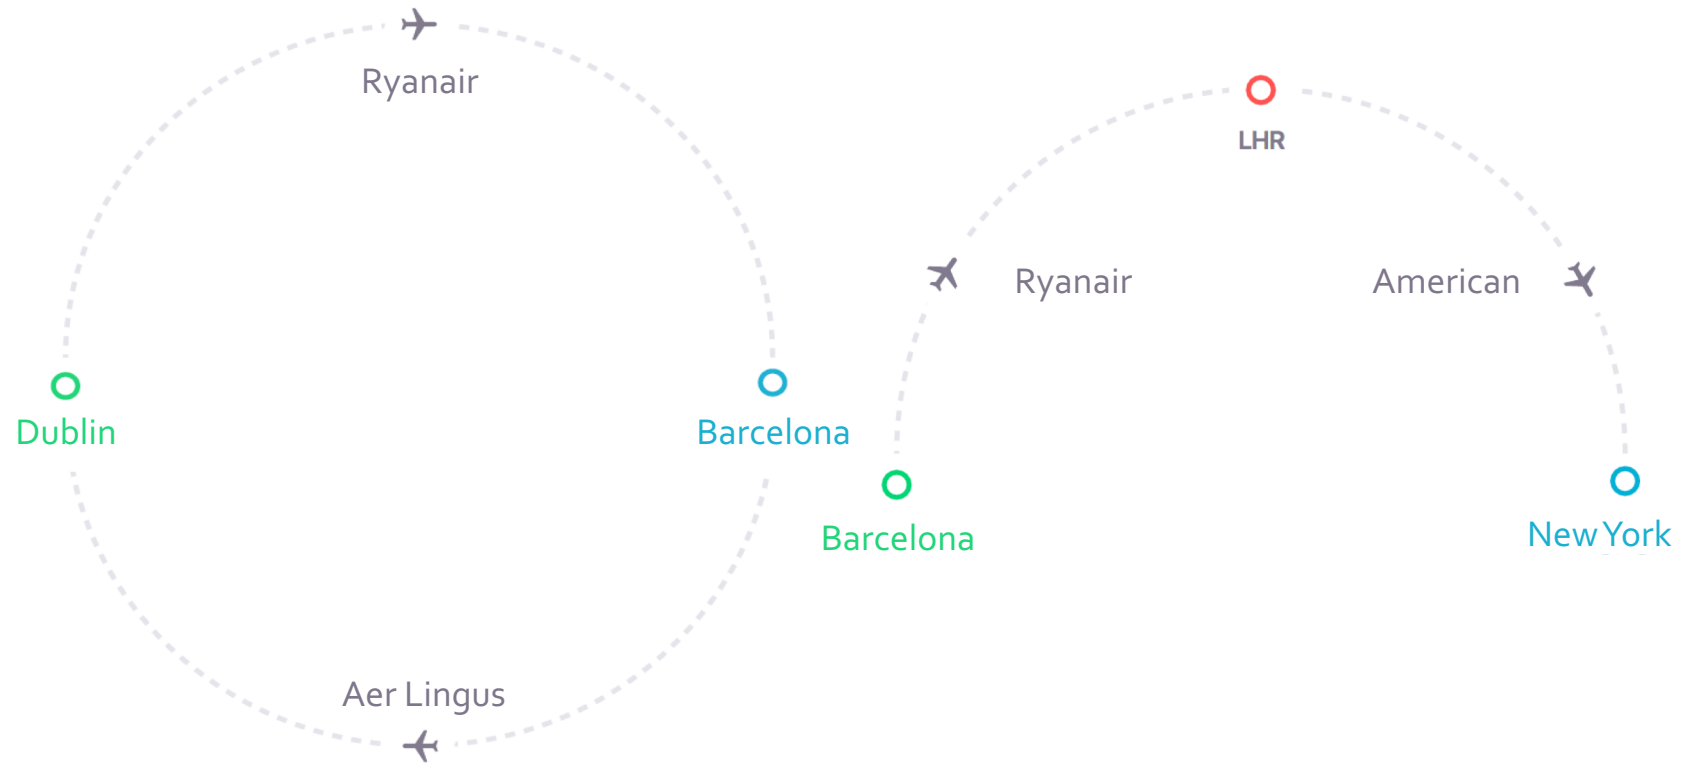

New vs. Optimizing Old Features

- it's easier to build new ML feature than optimizing what works OK already

Second Try: Constructed Itineraries

Constructing mixed-carrier itineraries

Competitive Itineraries

 06:15 DUB	2h 30 Direct	09:45 BCN	£163 Select → 2 bookings required
 12:50 BCN	2h 40 Direct	14:30 DUB	
 12:30 DUB	2h 30 Direct	16:00 BCN	£164 Select → 2 bookings required
 23:00 BCN	2h 40 Direct	00:40 DUB	
 15:00 DUB	2h 30 Direct	18:30 BCN	9 deals from £175 Select →
 23:00 BCN	2h 40 Direct	00:40 DUB	
 12:30 DUB	2h 30 Direct	16:00 BCN	1 deal £176 Select →
 16:45 BCN	2h 45 Direct	18:30 DUB	
 12:30 DUB	2h 30 Direct	16:00 BCN	£177 Select → 2 bookings required
 12:50 BCN	2h 40 Direct	14:30 DUB	
Operated by Vueling Airlines			
 17:10 DUB	2h 30 Direct	20:40 BCN	1 deal £178 Select →
 10:20 BCN	2h 50 Direct	12:10 DUB	
 06:15 DUB	2h 25 Direct	09:40 BCN	£179 Select → 2 bookings required
 21:15 BCN	2h 45 Direct	23:00 DUB	

Competitive Itineraries are the ones in the **Top-10** cheapest search results

£87.61
22 Mar 2018, 12:30 DUB-BCN

 **Select →**

★★★★★ 65541

£76.15
25 Mar 2018, 23:00 BCN-DUB

 **Select →**

★★★★★ 3084

Potentially cheaper itineraries in more than half of all search results

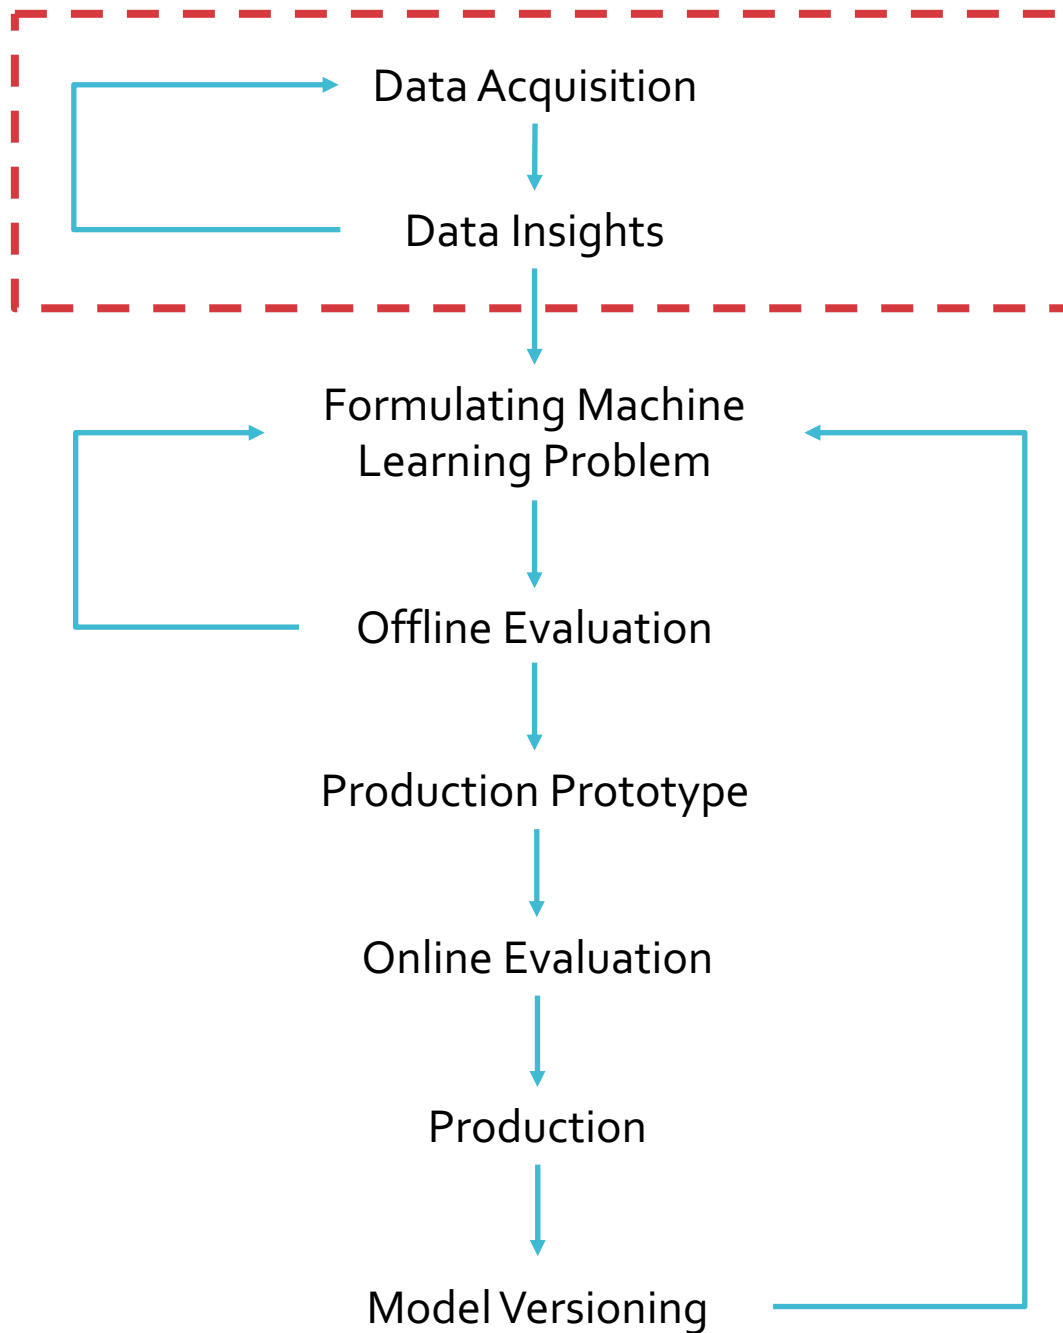

Problem

- Combinations require more queries to ticket providers
- Most of variants are not competitive

Solution: Only choose combinations which are likely to be competitive

Product Cycle

 12:30 DUB	2h 30 Direct	16:00 BCN	1 deal £176
 16:45 BCN	2h 45 Direct	18:30 DUB	Select →
 12:30 DUB	2h 30 Direct	16:00 BCN	£177
first page results			
 17:10 DUB	2h 30 Direct	20:40 BCN	1 deal £178
 10:20 BCN	2h 50 Direct	12:10 DUB	Select →
 06:15 DUB	2h 25 Direct	09:40 BCN	£179
 21:15 BCN	2h 45 Direct	23:00 DUB	Select → 2 bookings required

what users click on

what users see but do not click on

what users do not see

- it is important to log negative samples
- it is important to allow exploration
- non-trivial data pre-processing ETL jobs are needed
- along with robust querying interfaces (e.g., Athena)

Competitive Combinations

 06:15 DUB → 09:45 BCN Direct	2h 30	 12:50 BCN → 14:30 DUB Direct	2h 40	£163 Select → 2 bookings required
 12:30 DUB → 16:00 BCN Direct	2h 30	 23:00 BCN → 00:40 DUB Direct	2h 40	£164 Select → 2 bookings required
 15:00 DUB → 18:30 BCN Direct	2h 30	 23:00 BCN → 00:40 DUB Direct	2h 40	9 deals from £175 Select →

 12:30 DUB → 16:00 BCN Direct	2h 30	 12:50 BCN → 14:30 DUB Direct	2h 40	£177 Select → 2 bookings required <small>Operated by Vueling Airlines</small>
 17:10 DUB → 20:40 BCN Direct	2h 30	 10:20 BCN → 12:10 DUB Direct	2h 50	1 deal £178 Select →
 06:15 DUB → 09:40 BCN Direct	2h 25	 21:15 BCN → 23:00 DUB Direct	2h 45	£179 Select → 2 bookings required

Tips for booking your next flight

- good for last minute booking
- average savings of 9% on return ticket
- 90% of competitive combinations are from top-30% airlines
- good deals when flying from US, UK, Spain, Germany, Italy and other origins

Supervised Learning

Metrics

Coverage: How many of all possible cheap itineraries we recall

Cost: How much queries for flight quotes are required

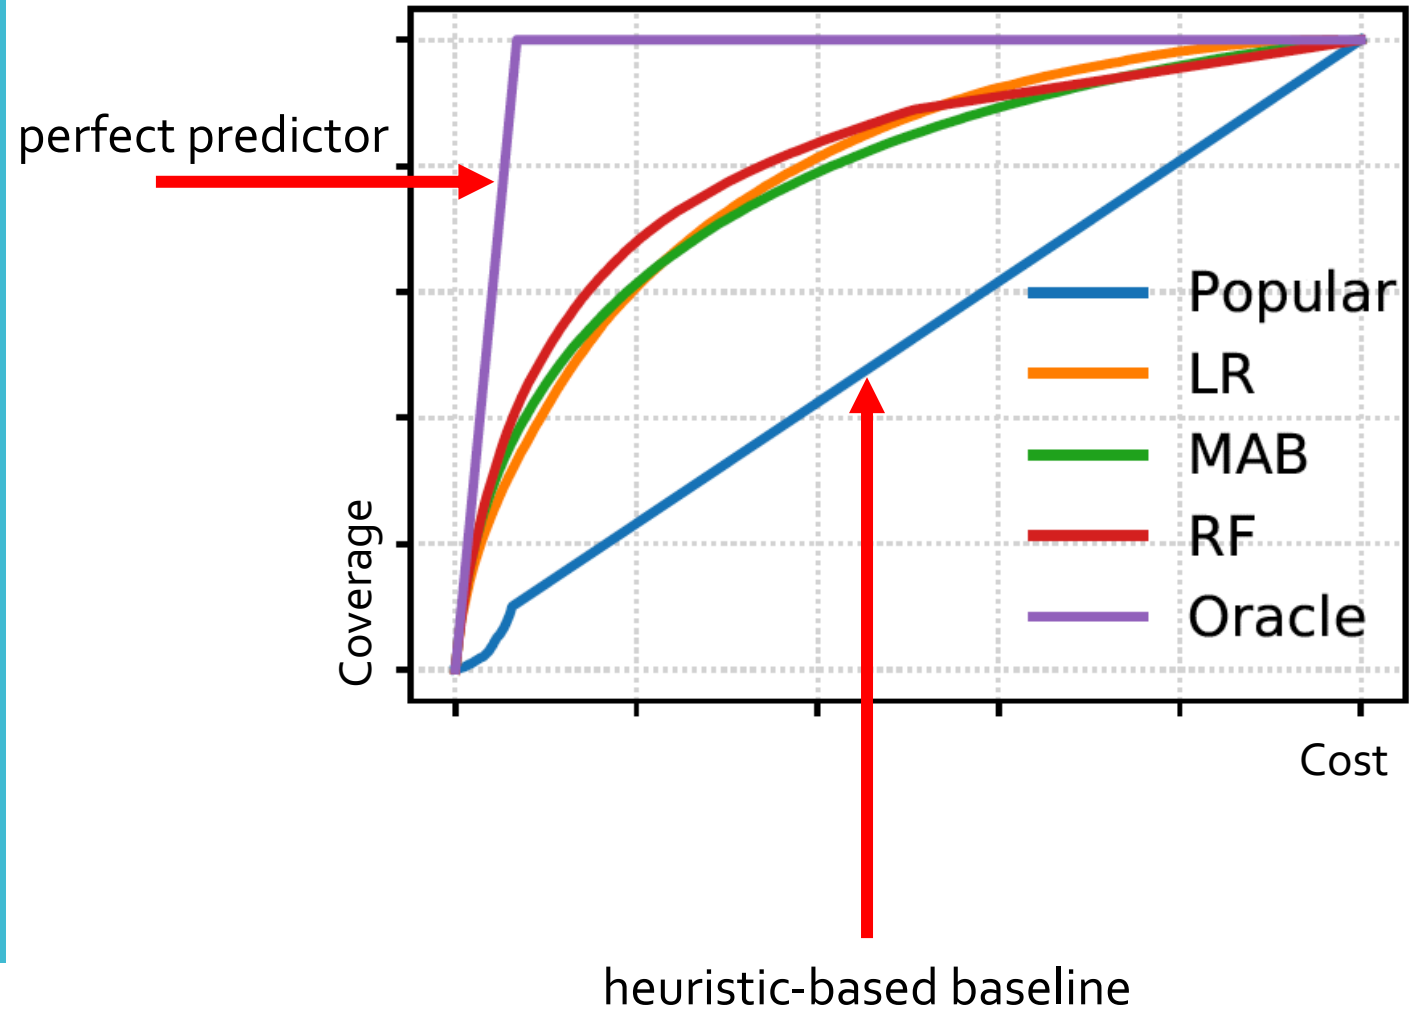

Classify whether for a query Q a combination of partners (X and Y) is going to be in **Top-10 search results**

Dataset

- sample all possible combinations for a share of searches
- collect examples of competitive and non-competitive combinations

Supervised Learning

Use your favorite classifier

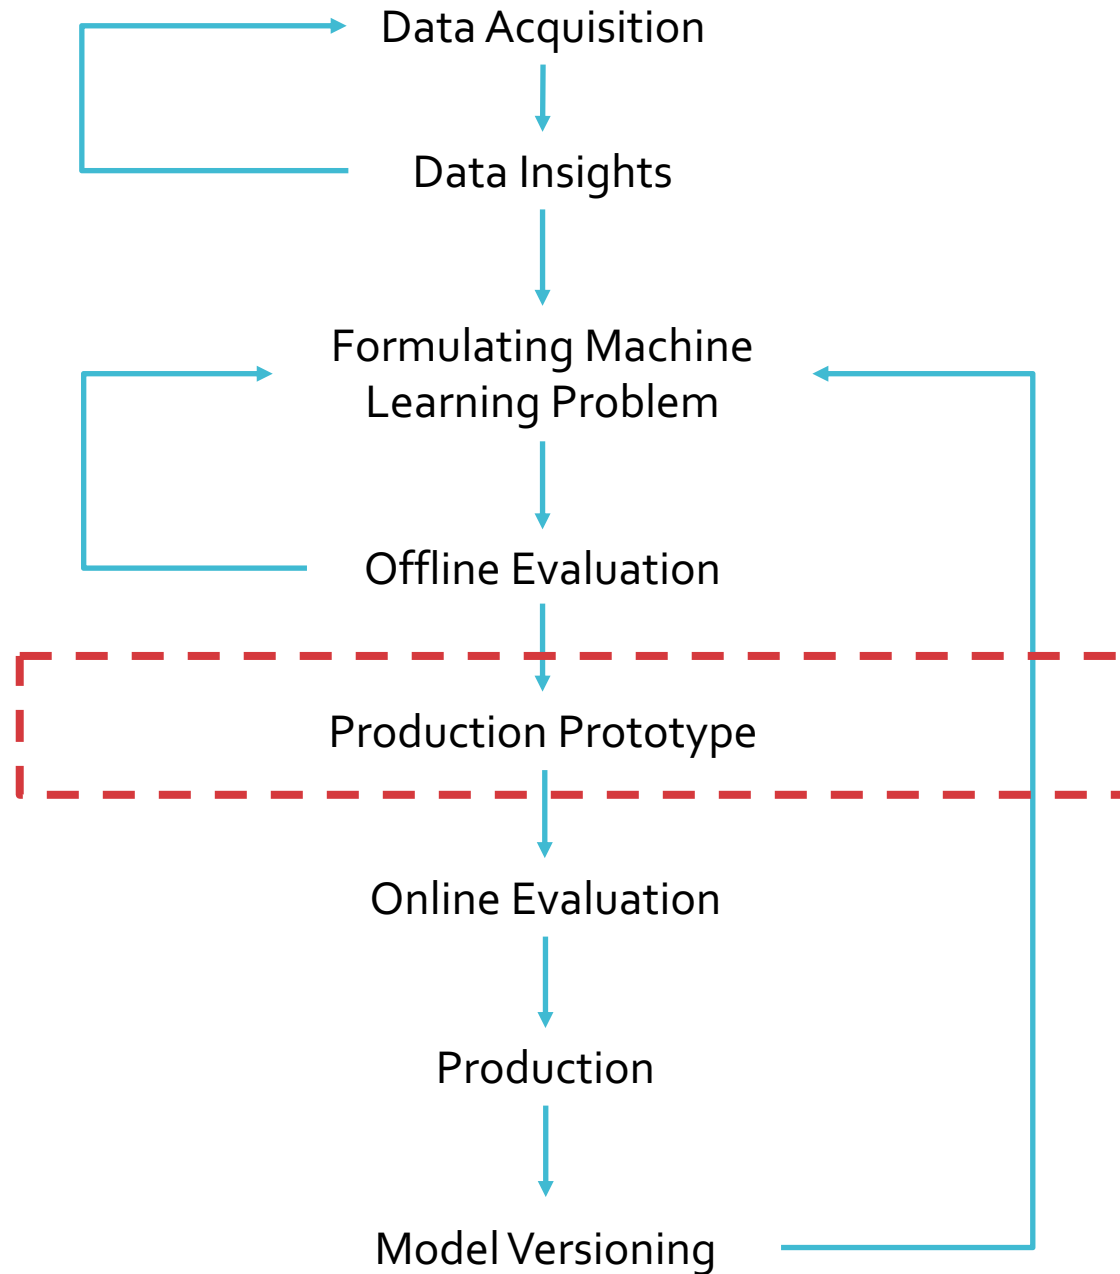

Supervised Learning

In practice

Tree ensembles (Random Forest) achieve good performs

Product Cycle

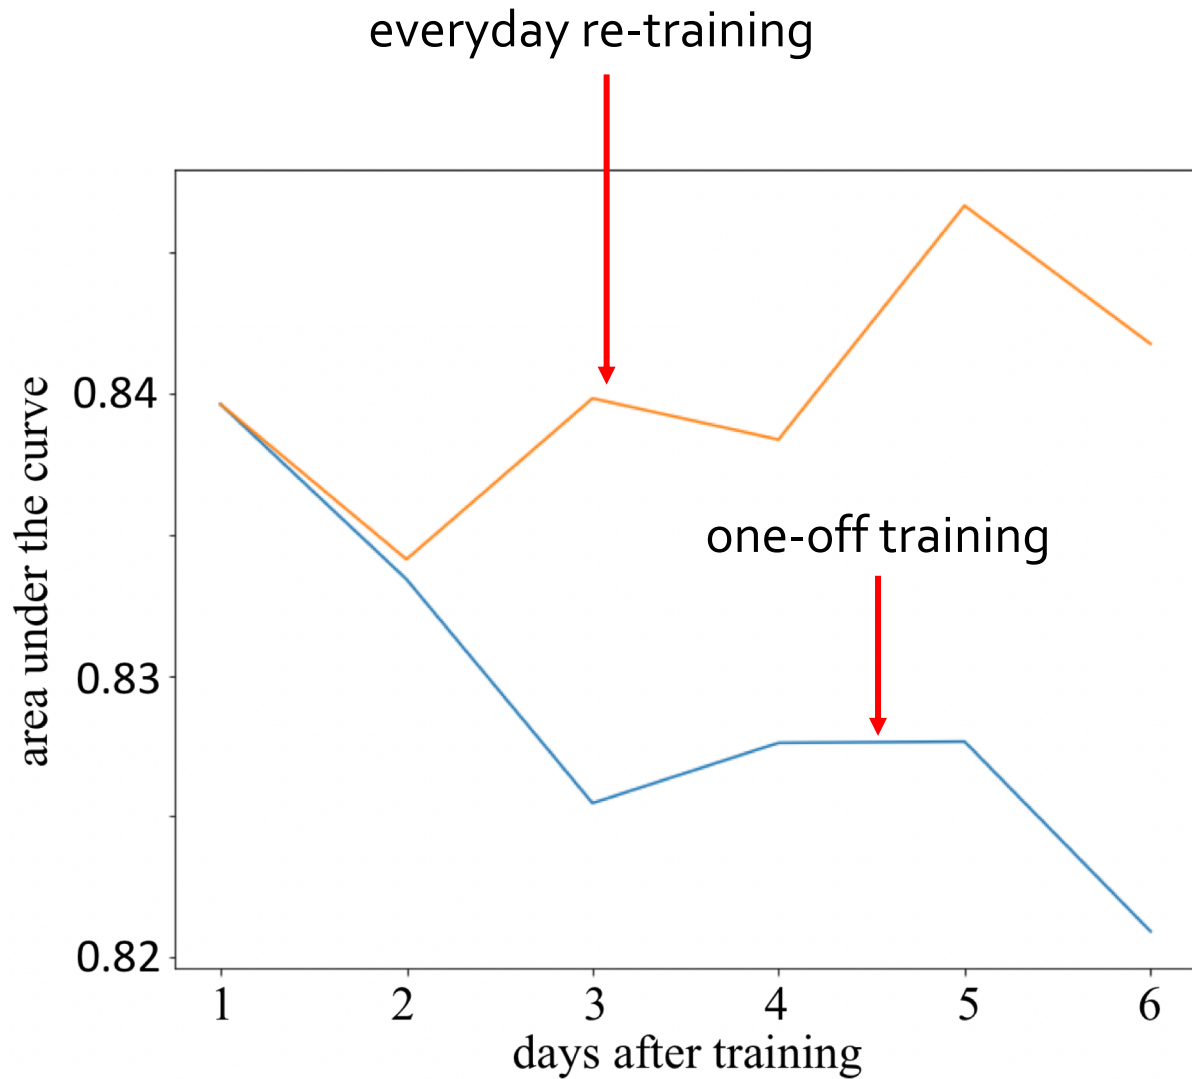

Lean Prototyping

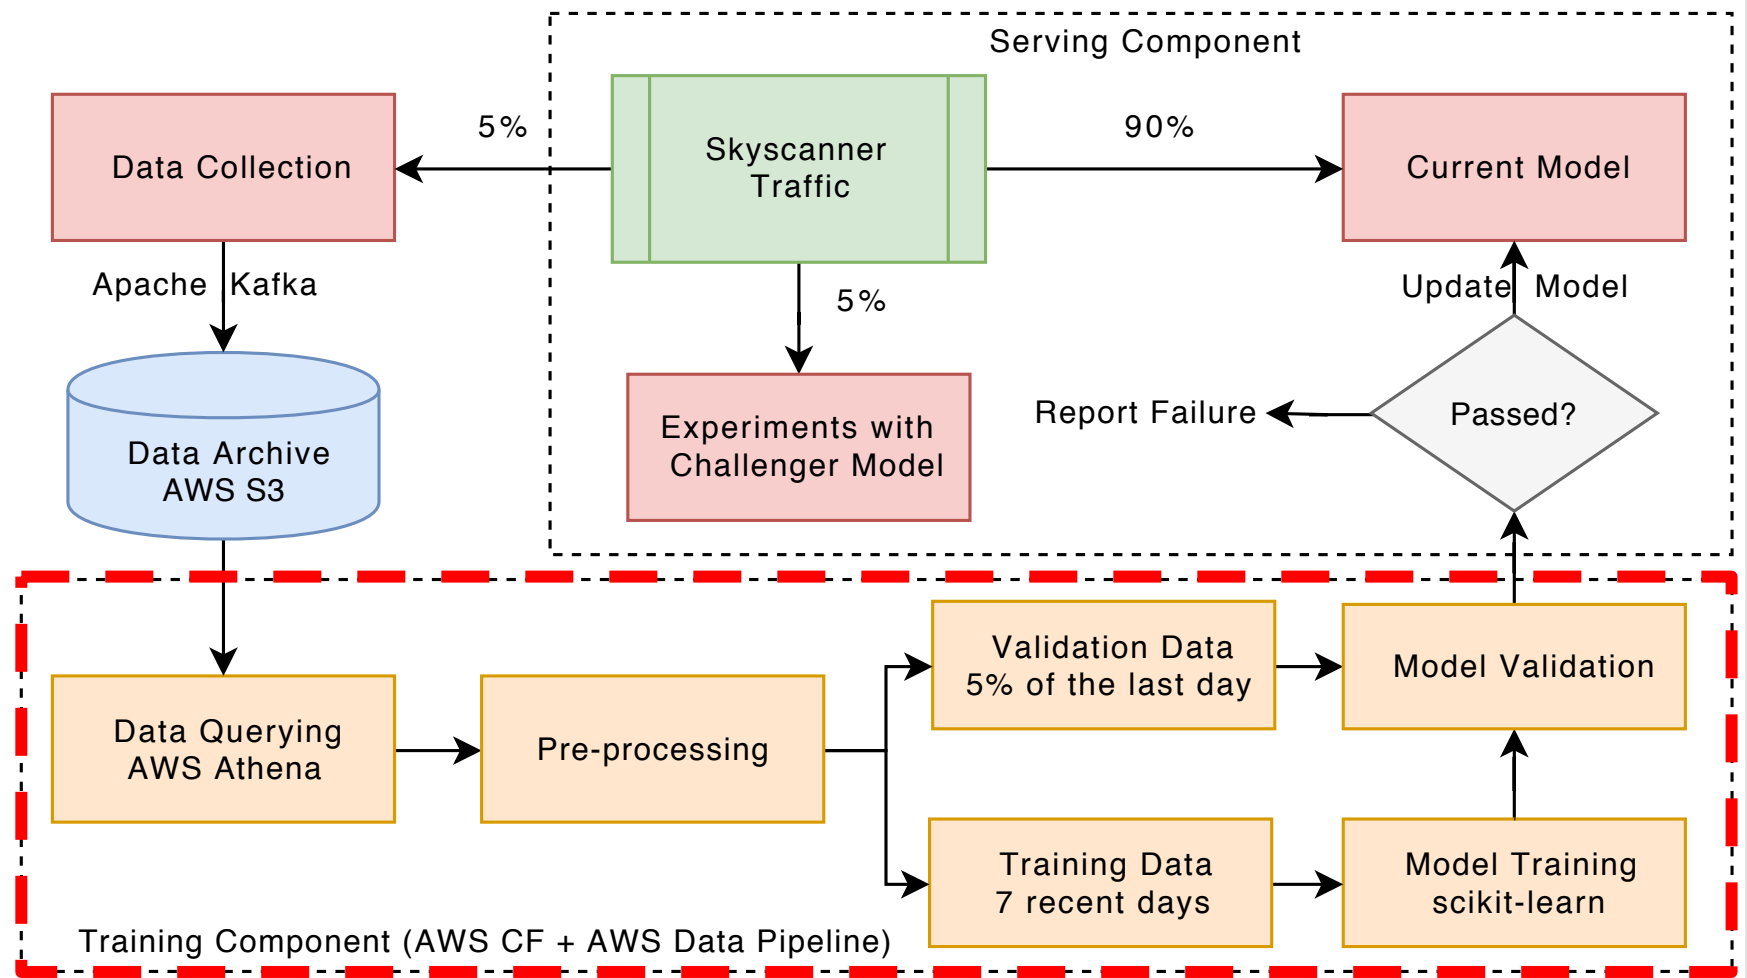

- simple model trained in a Jupyter Notebook
- very hacky setup in production on a tiny share of traffic
- proved the value of ML optimization

Model Staleness

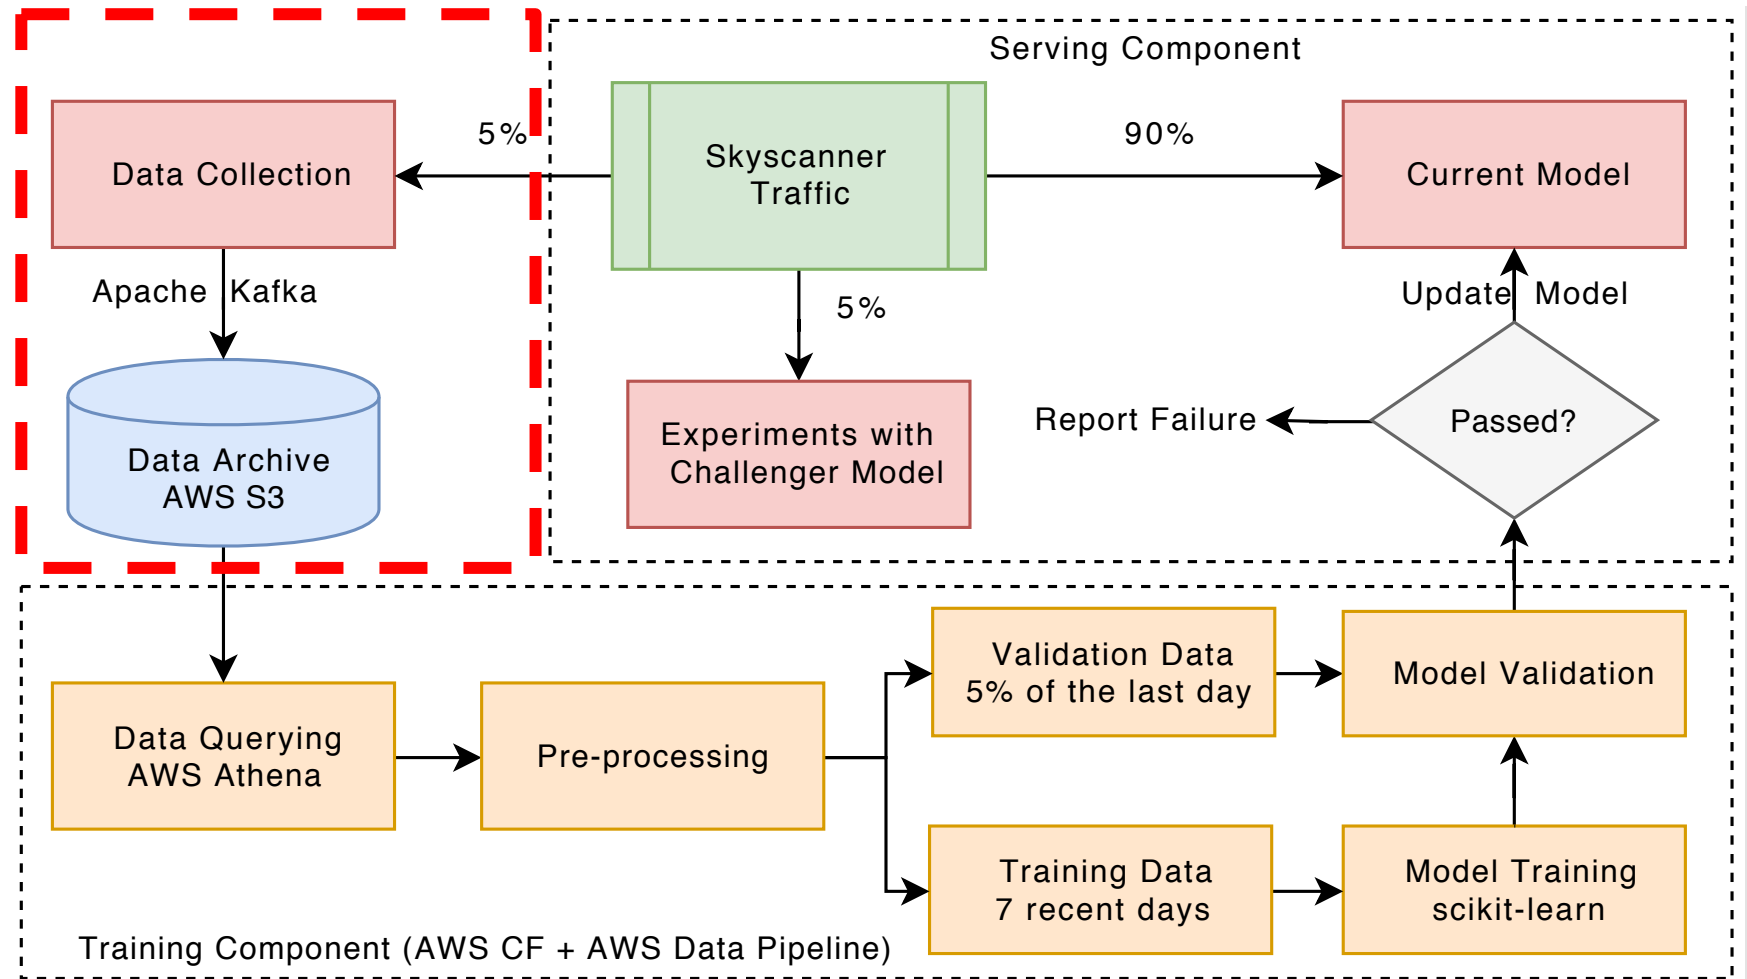

Performance of the model stales, hence needs to be updated regularly

Production Pipeline

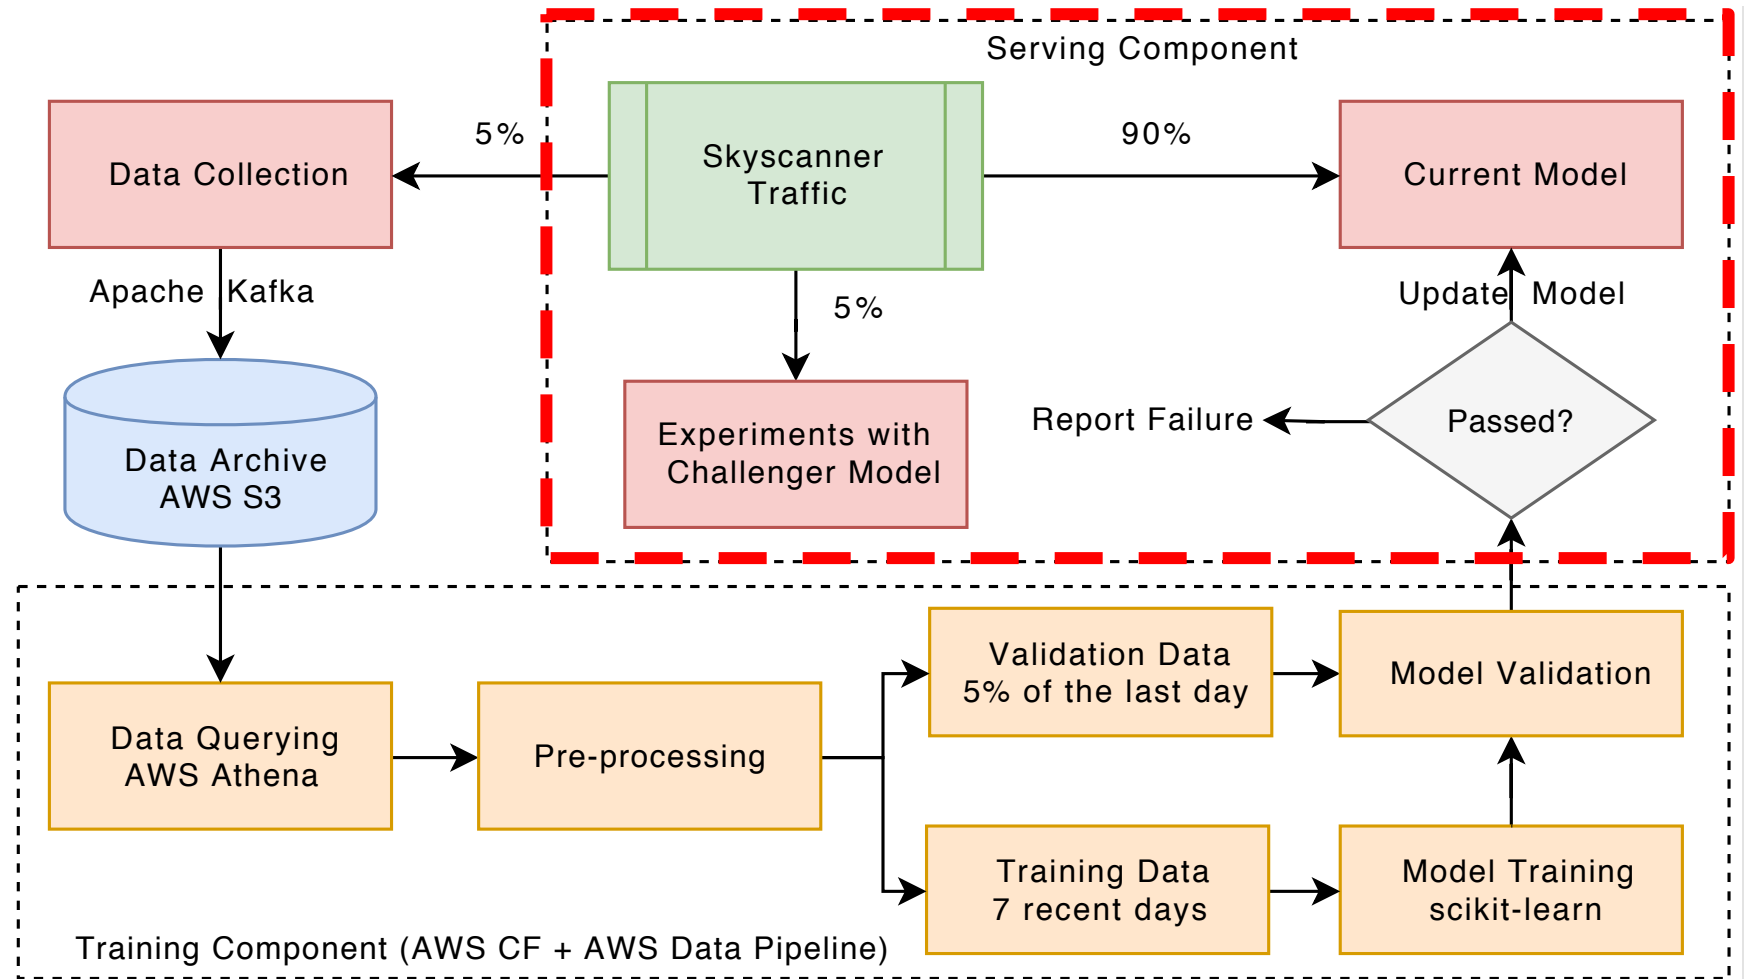

- re-train the model everyday against model drift
- run on a single large machine vs. distributed cluster

Production Pipeline

- sample all possible combinations on 5% of users' traffic

Production Pipeline

- update the model if it passes the tests and serve it to 90% of the users
 - leave 5% for A/B experiments with better models

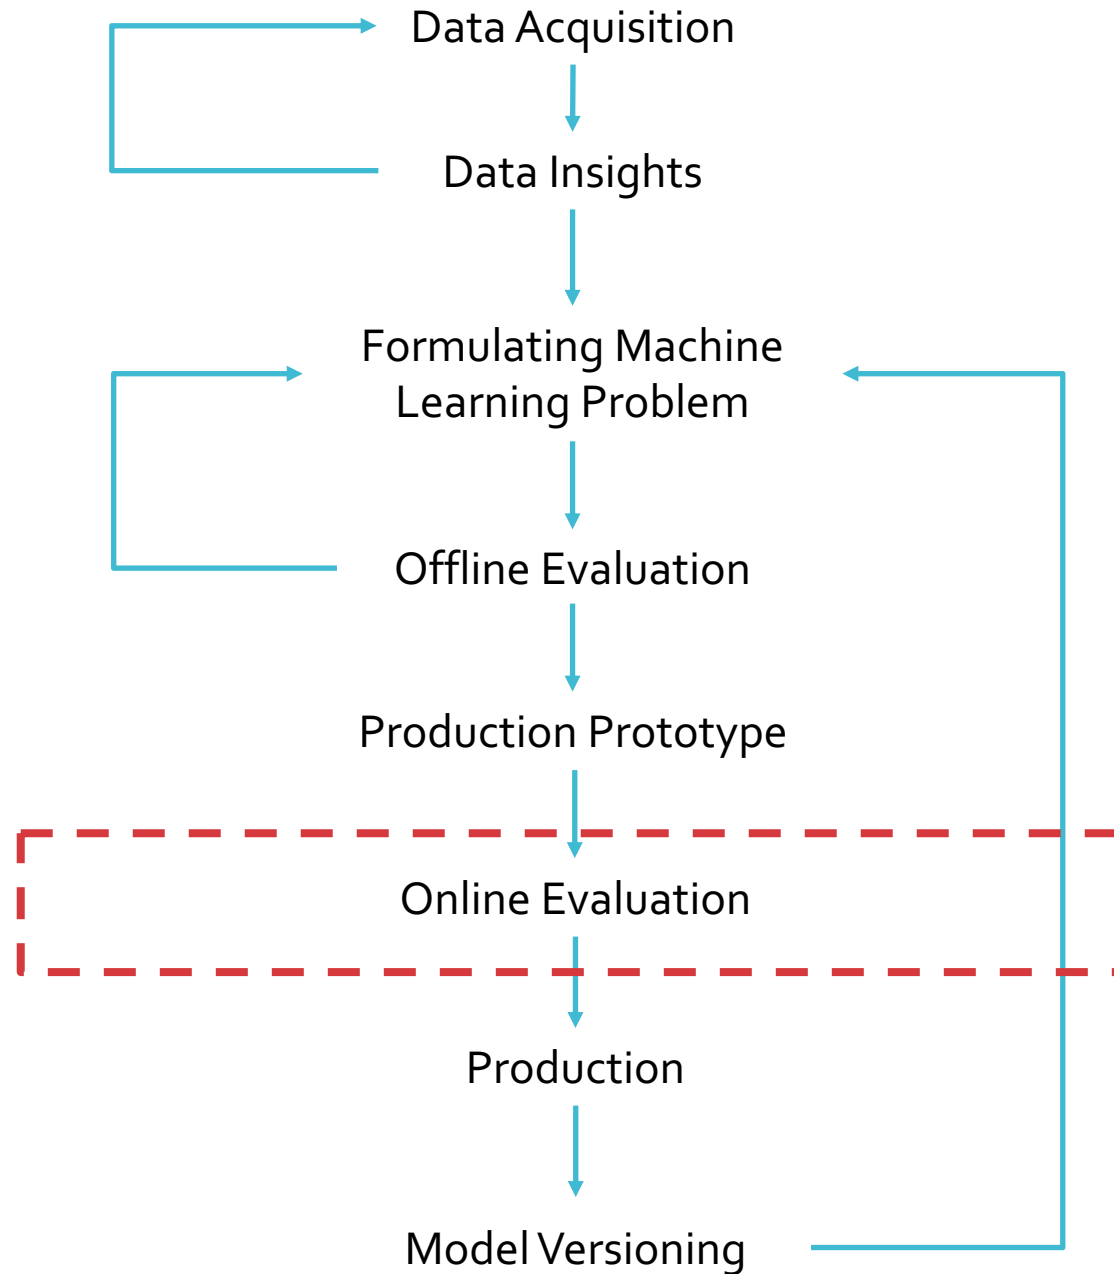

Temporal Stability

(Origin, Destination, Provider) rules

We need a mechanism to control temporal stability of the model

Product Cycle

Online Experiments

A

CONTROL

B

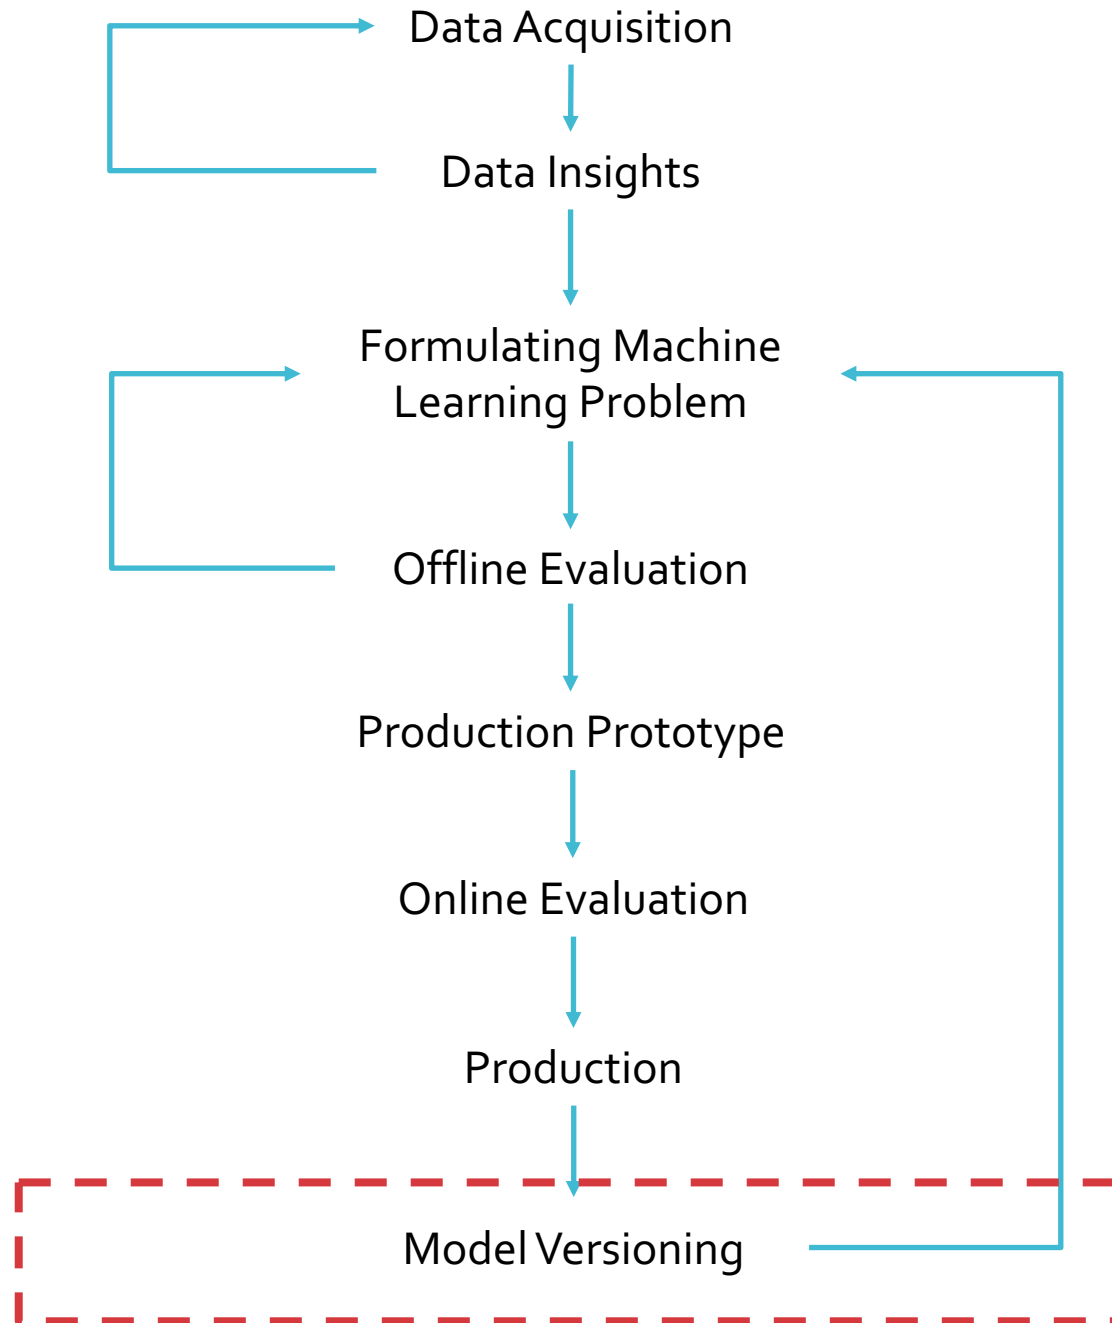

VARIATION

- + Test in the real world
- + Benchmark in equal conditions
- Some things are difficult to A/B test
- Online experiments might be expensive

Travelers First

- 45% of all competitive combinations for only 5% of the cost
- 22% of search results with cheaper itineraries
- 20% rel. increase in bookings on combination itineraries
- 0.74% rel. increase in user retention

Product Cycle

Can we improve performance with smart feature engineering?

Feature Engineering

One-hot encoding

London Gatwick	[1 0 0 ... 0]
London Stansted	[0 1 0 ... 0]
Barcelona	[0 0 1 ... 0]

Better encoding

London Gatwick	[1.0 0.9 0.9 ...]
London Stansted	[1.0 0.9 0.1 ...]
Barcelona	[0.0 1.0 0.5 ...]

London
European
Trans-Atlantic

Location Embeddings

word

[London, Barcelona, Frankfurt am Main, New York,] — sentence

- **Option N1:** Every user's history is a sentence (think of Word2Vec)
- **Option N2:** Learn embeddings on graphs of locations

Perozzi et al., KDD, 2014.

- **Option N3:** Train embeddings for target problem

Location Embeddings

London Heathrow		Beijing Capital	
Airport	Similarity	Airport	Similarity
Frankfurt am Main	0.71	Chubu Centrair	0.91
Manchester	0.69	Taipei Taoyuan	0.90
Amsterdam Schipol	0.62	Seoul Incheon	0.90
Paris Charles de Gaulle	0.62	Miyazaki	0.88
London Gatwick	0.61	Shanghai Pudong	0.88

- Capture geographical proximity (Europe vs. Asia)
- Learn function of the airport (Heathrow and Gatwick vs. Stansted)
- Produce a slight improvement in prediction performance

Learnings

- **focus on right problems** which cannot be solved without ML or where ML gives 10x improvement
- **define the metrics and optimization objective** at the start of the project and stick to them thereafter
- **bootstrapping ML projects** requires 20% of modeling and 80% of engineering – in the long run should be vice versa
- **lean online experiments** are important on early stages to make sure users engage with the product
- **ML behavior in production** reveals interesting problems which are not visible during offline modeling (e.g., temporal stability)
